

Superstore Sales Analysis Report

1. Objective

The objective of this project is to analyze the Superstore dataset using SQL to uncover key business insights related to sales, profit, customer behavior, and regional performance.

2. Dataset Overview

The dataset contains transactional sales data including Orders, Customers, Products, Sales, Profit, Discounts, Regions and Cities.

3. Key Findings & Insights

Sales & Profit Overview

The company generated significant overall sales, but profit varies across categories and regions. High revenue does not guarantee profitability.

Recommendation: Focus on optimizing cost and discount strategies.

Regional Performance

Certain regions contribute more to total sales. One region shows the highest average order value.

Recommendation: Target high-performing regions with premium products and marketing.

Product & Category Analysis

Some products consistently generate losses while others have higher profit margins.

Recommendation: Remove or optimize loss-making products and focus on high-margin categories.

Customer Behavior

A small group of customers contributes significantly to total revenue.

Recommendation: Implement loyalty programs and target repeat customers.

Discount Impact

High discounts are often associated with negative profit.

Recommendation: Control discount levels and analyze effectiveness.

Time-Based Trends

Sales vary across months and show seasonality.

Recommendation: Plan inventory and marketing based on peak periods.

4. Advanced Analysis Highlights

Used window functions, multi-level aggregation, and identified key business patterns such as top customers and loss-making products.

5. Conclusion

This analysis provides actionable insights to improve profitability, customer retention, and strategic decision-making.

6. Tools Used

SQL (MySQL), Superstore Dataset
